### Contents of this talk

### This slide is intentionally left blank

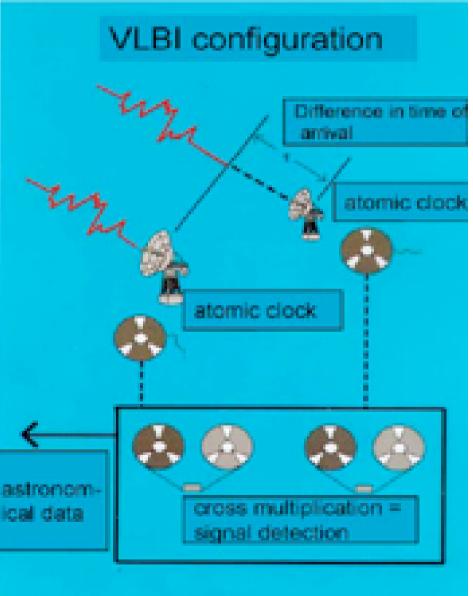

# VLBI

er term VLBI is easily capable of generating many Gb of data per

The sensitivity of the VLBI array scales v (rdata-rate) and there is a strong push to r Rates of 8Gb/s or more are entirely feasible iden development. It is expected that paraliprrelator will remain the most efficient approx s distributed processing may have an applilti-gigabit data streams will aggregate into la pr and the capacity of the final link to the da tor.

Westerbork Synthesis Radio Telescope -Netherlands

## iGrid 2002

### September 24-26, 2002, Amsterdam, The Netherlands

- 28 demonstrations from 16 countries: Australia, Canada, CERN, France, Finland, Germany, Greece, Italy, Japan, The Netherlands, Singapore, Spain, Sweden, Taiwan, United Kingdom, United States
- Applications demonstrated: art, bioinformatics, chemistry, cosmology, cultural heritage, education, high-definition media streaming, manufacturing, medicine, neuroscience, physics, tele-science

- Grid technologies demonstrated: Major emphasis on grid middleware, data management grids, data replication grids, visualization grids, data/visualization grids, computational grids, access grids, grid portals
- 25Gb transatlantic bandwidth (100Mb/attendee, 250x iGrid2000!)

iGrid 2002 Sept 24-26, 2002, Amsterdam, The Netherlands

Conference issue FGCS Volume 19 (2003) Number 6 august 22 refereed papers!

THESE ARE THE APPLICATIONS!

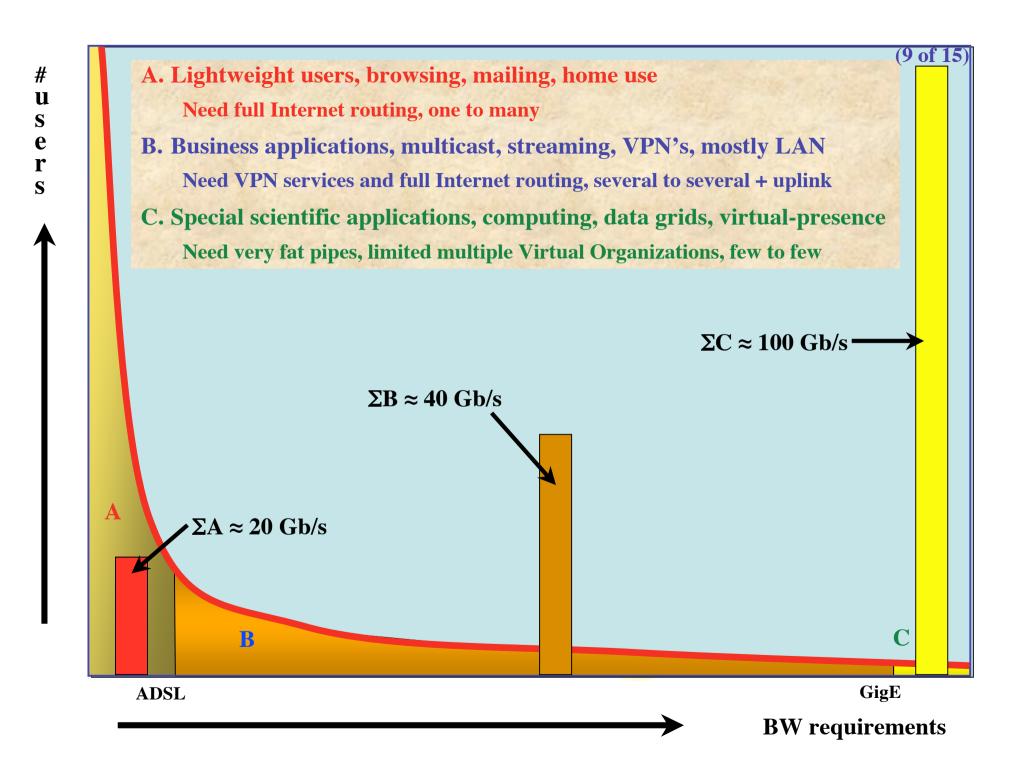

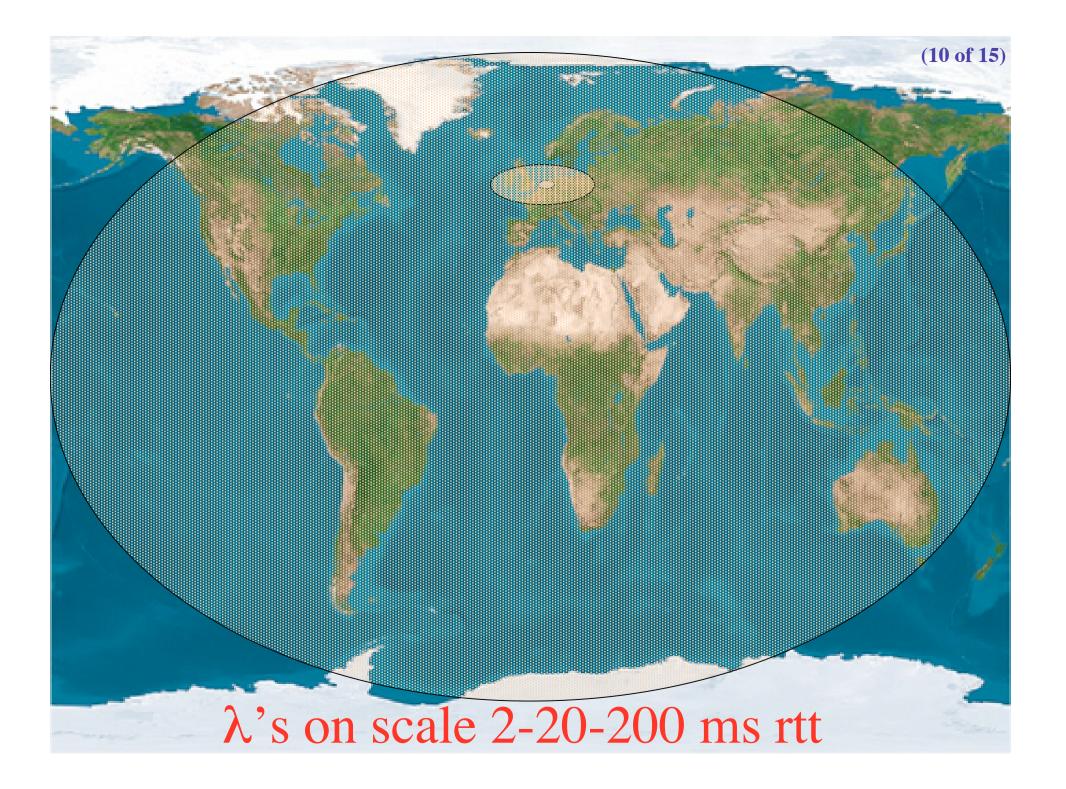

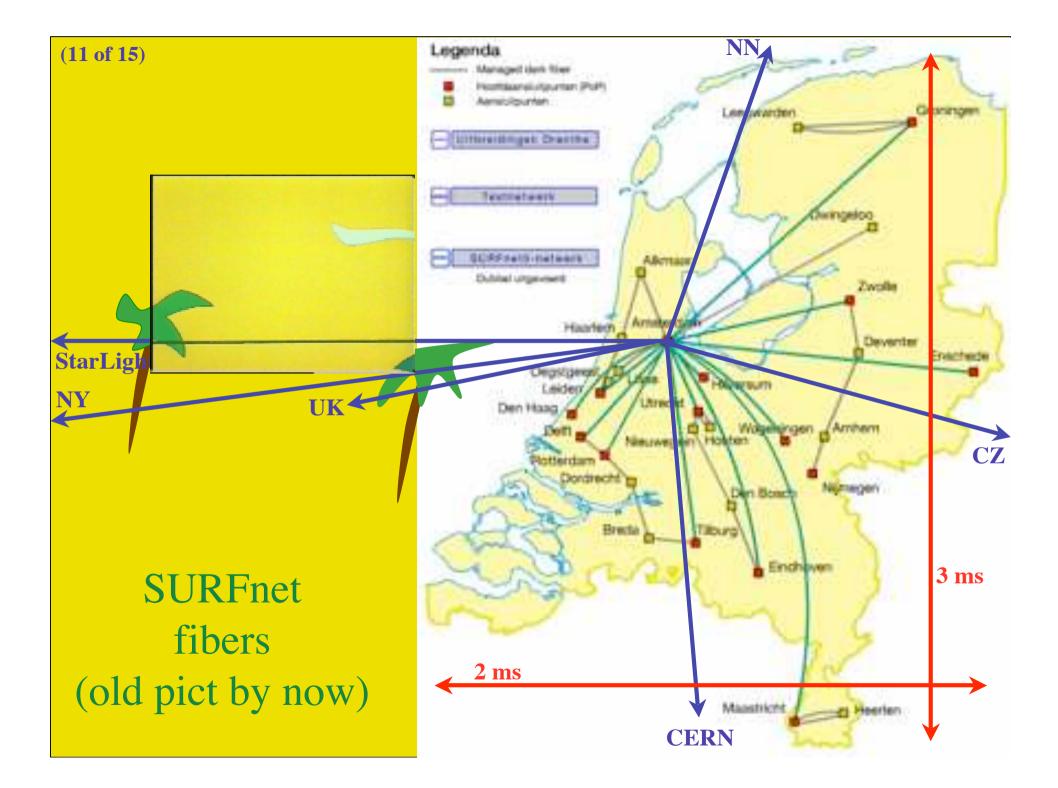

## The Dutch Situation

- Estimate A
  - 17 M people, 6.4 M households, 25 % penetration of 0.5 Mb/s ADSL, 40 times under-provisioning ==> 20 Gb/s
- Estimate B
  - SURFnet has 10 Gb/s to about 12 institutes and 0.1 to 1 Gb/s to 180 customers, estimate same for industry (overestimation) ==> 20-40 Gb/s
- Estimate C

– Leading HEF and ASTRO + rest ==> 80-120 Gb/s

## The only formula's

(12 of 16)

 $200 * e^{(t-2002)}$  $\#\lambda(rtt,t) \approx$ rtt

Now, having been a High Energy Physicist we set c = 1 e = 1  $\bar{h} = 1$ and the formula reduces to:  $\# \lambda(rtt, t) \approx \frac{200 * e^{(t-2002)}}{rtt}$ 

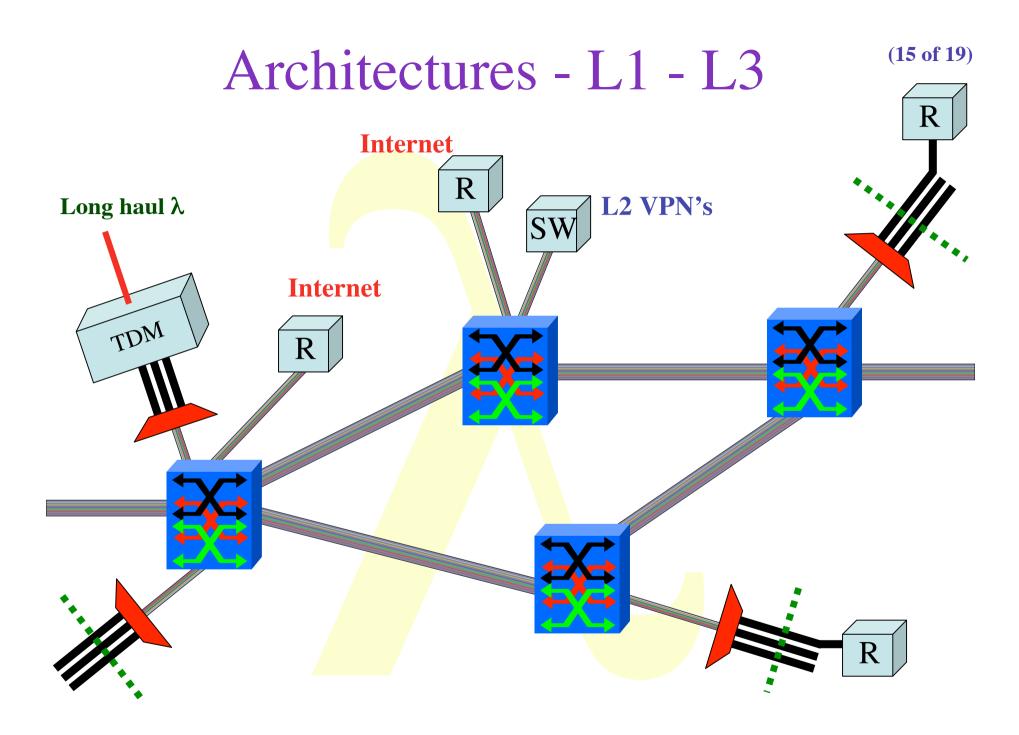

### So what are the facts

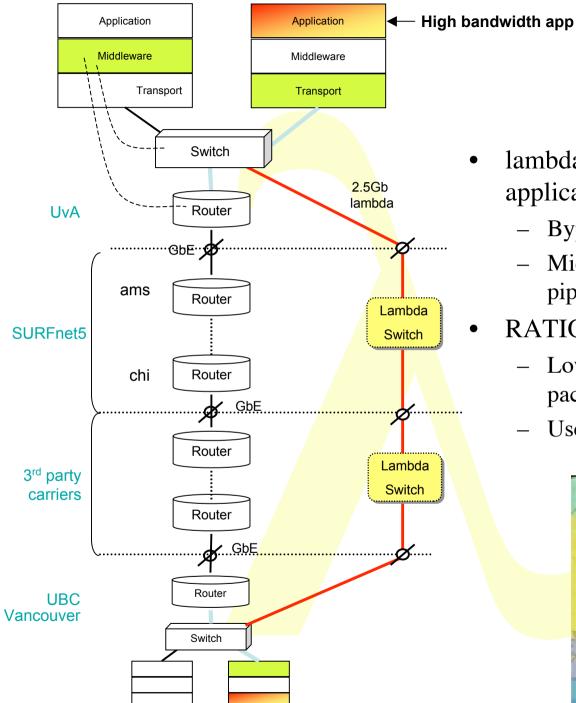

- Costs of fat pipes (fibers) are one/third of cost of equipment to light them up
  - Is what Lambda salesmen tell me
- Costs of optical equipment 10% of switching 10% of full routing equipment for same throughput
  - 100 Byte packet @ 40 Gb/s -> 20 ns to look up in 140 kEntries routing table (light speed from me to you!)
- Big sciences need fat pipes
- Bottom line: look for a hybrid architecture which serves all classes in a cost effective way (A -> L3, B -> L2, C -> L1)
- Tested 10 gbps Ethernet WANPHY Amsterdam-CERN
  - http://www.surfnet.nl/en/publications/pressreleases/021003.html

(**14 of 18**)

### Services

SCALE	2 Metro	20 National/	200 World
CLASS		regional	
A	Switching/ routing	Routing	ROUTER\$
B	Switches + E-WANPHY VPN's,	Switches + E-WANPHY (G)MPLS	ROUTER\$
C	dark fiber Optical switching	Lambda switching	Sub-lambdas, ethernet-sdh

lambda for high bandwidth applications

- Bypass of production network \_
- Middleware may request (optical) \_ pipe

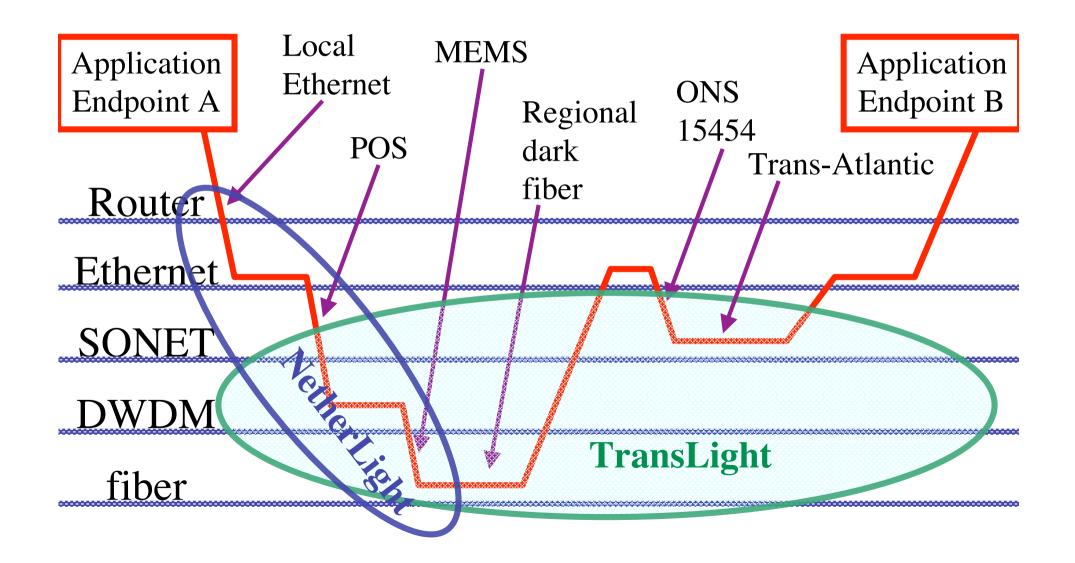

(16 of 20)

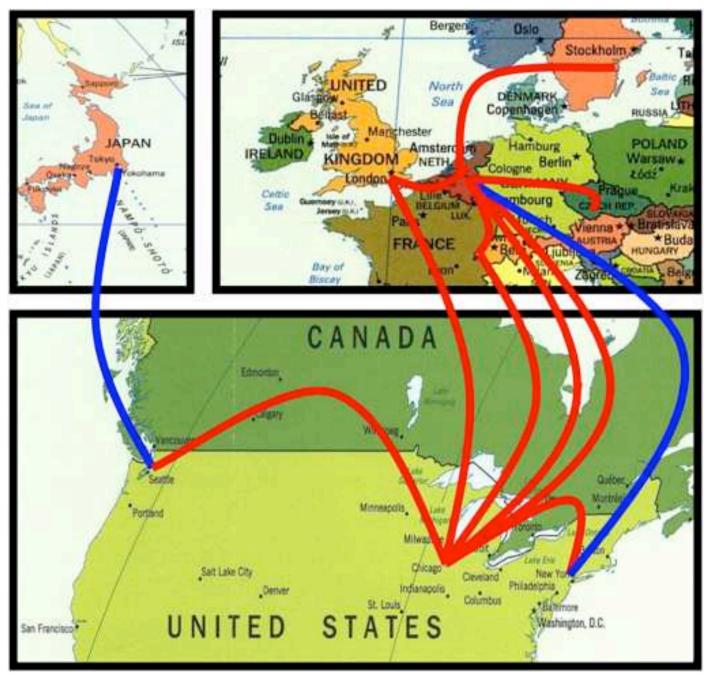

- **RATIONALE:** 
  - Lower the cost of transport per \_ packet
  - Use Internet as controlplane! \_

(**17 of 20**)

### How low can you go?

### TransLight Lambdas

#### European lambdas to US

-6 GigEs Amsterdam—Chicago
-2 GigEs CERN—Chicago
-8 GigEs London—Chicago

#### Canadian lambdas to US

-8 GigEs Chicago—Canada—NYC

–8 GigEs Chicago—Canada—Seattle

#### **US lambdas to Europe**

-4 GigEs Chicago—Amsterdam

-2 GigEs Chicago-CERN

#### European lambdas

- -8 GigEs Amsterdam—CERN
- -2 GigEs Prague—Amsterdam
- –2 GigEs
- Stockholm—Amsterdam
- -8 GigEs London—Amsterdam

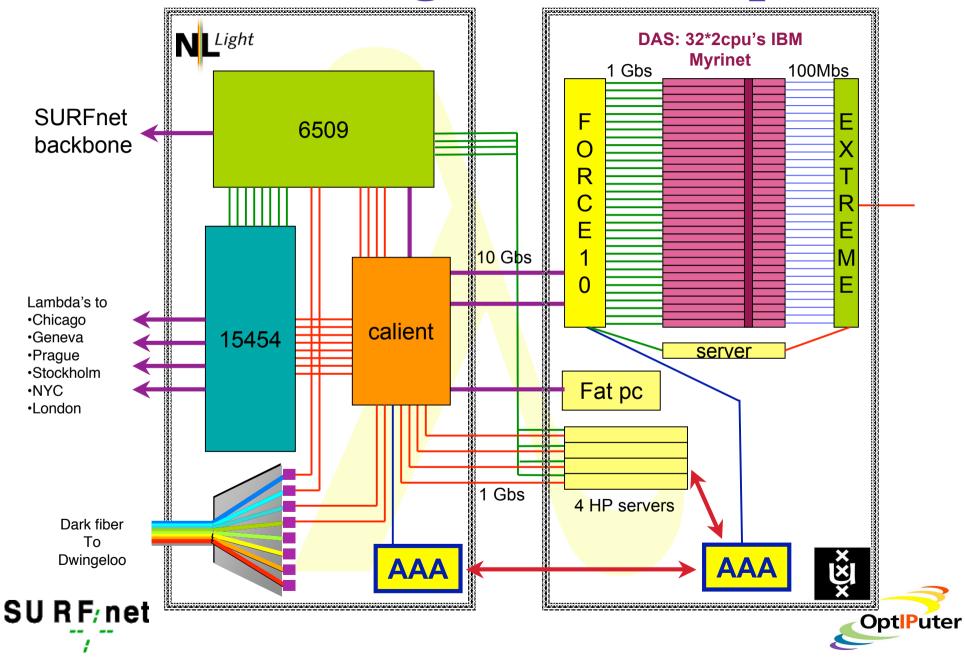

#### **IEEAF** lambdas (blue)

-8 GigEs Seattle-Tokyo

-8 GigEs NYC—Amsterdam

# **NetherLight UvA Setup**

(**19 of 21**)

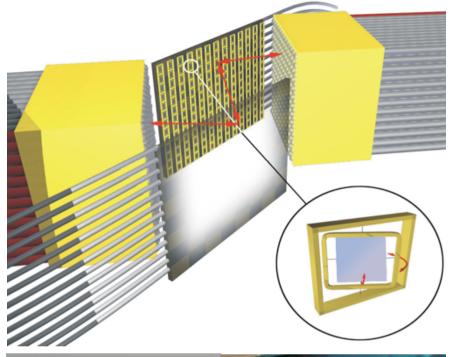

UVA/EVL's 64\*64 **Optical Switch** @ NetherLight in SURFnet POP @ SARA Costs 1/100th of a similar throughput router but with specific services!

### **Core Switch Technology**

### **3D MEMS structure**

- Bulk MEMS High Density Chips
- Electrostatic actuation
- Short path length (~4cm)
- <1.5 dB median loss</p>

### **Completely Non-blocking**

- Single-stage up to 1Kx1K
- 10 ms switching time

### **Excellent Transparency**

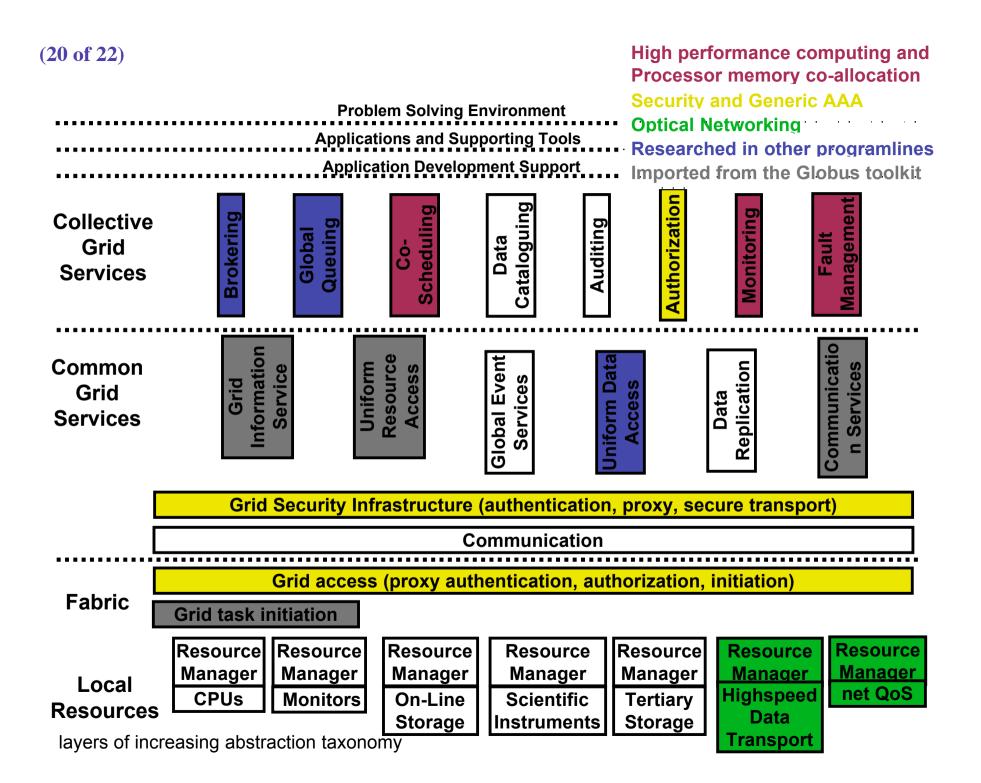

- Polarization
- Bit rate
- Wavelength

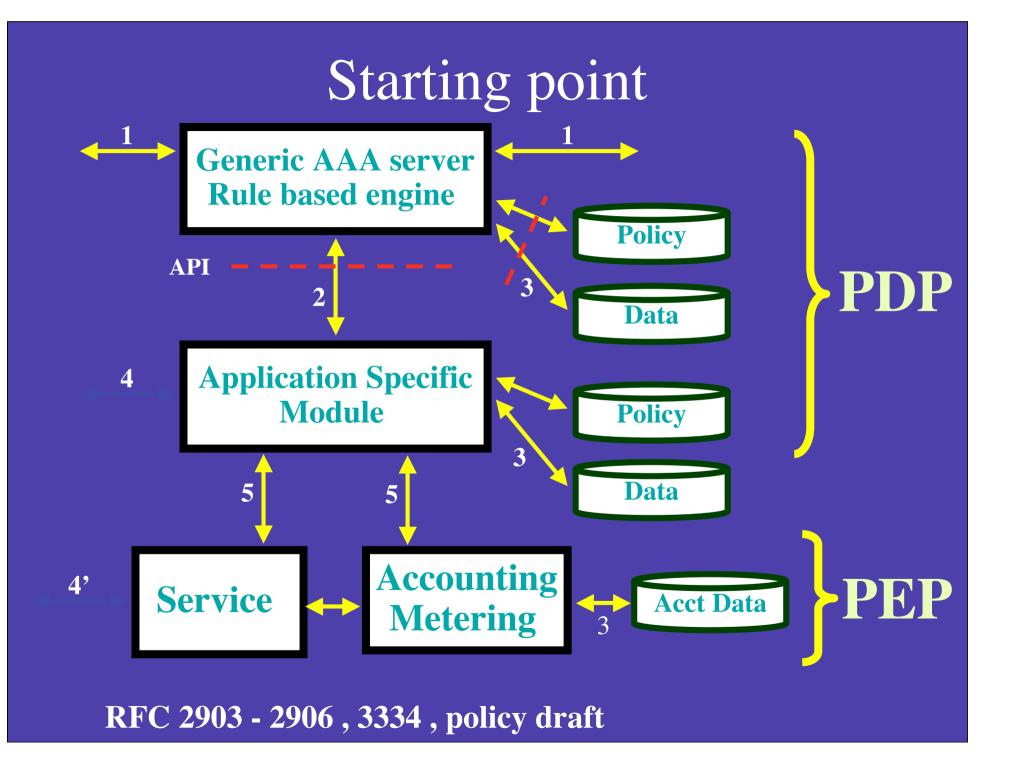

where innovation comes to light

06-04-03 Presentation Date

**Calient Confidential.** 

•

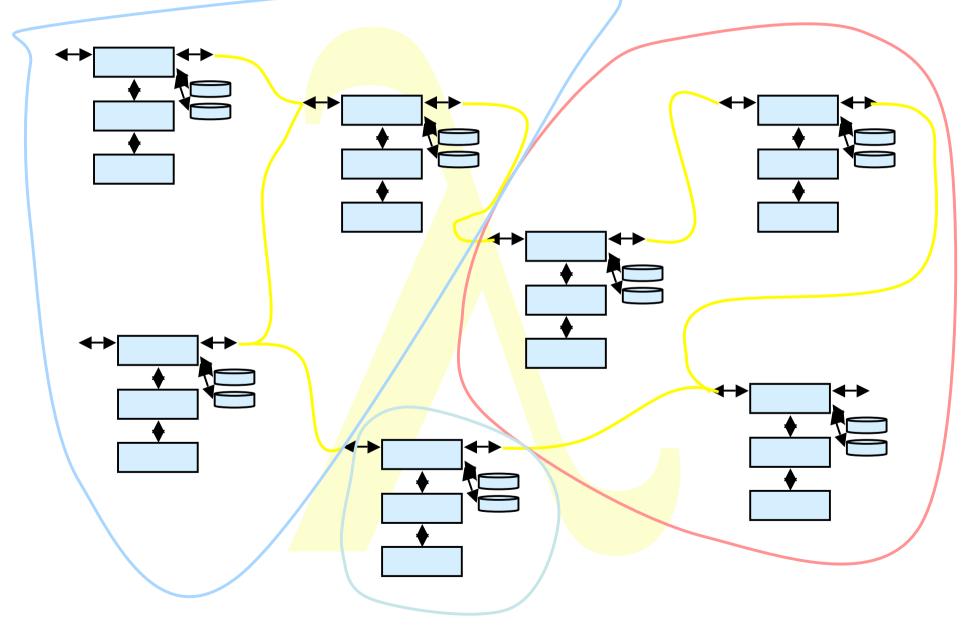

### Multi Domain Lambda setup

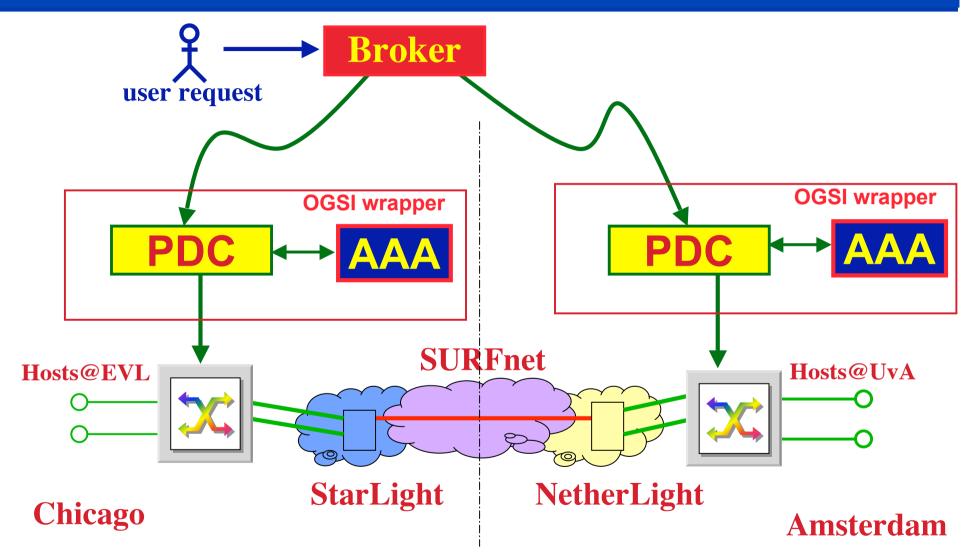

- AAA based on RFC 2903-2906
- OGSI wrapper
- Interface to CALIENT optical switch, layer 2 switches
- Interface to PDC
- Broker for path searching, selection
- Web and application interface
- Demonstration on SC2003

### Multi domain case

### Multi Domain Lambda setup

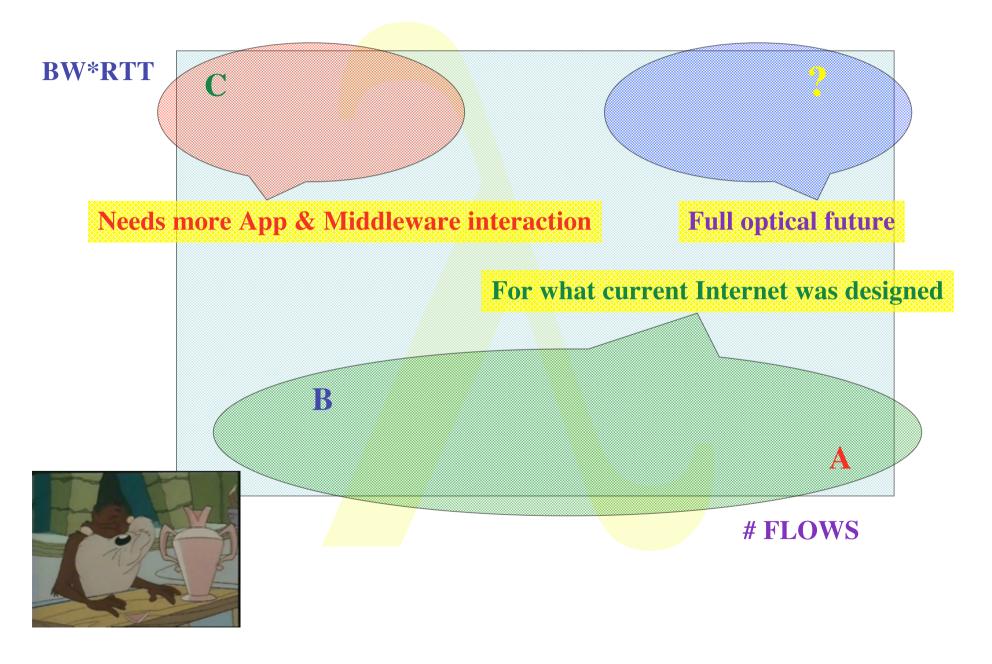

OptlPuter Chicago/International Infrastructure

## Research topics

- <u>Optical</u> networking architectures and models for usage
- Transport protocols for massive amounts of data
- Authorization of complex resources in multiple domains
- Embedding in Grid environments

### Transport in the corners

## Lambda workshop

- Amsterdam Terena
  - Concepts
  - Initial testbed (SURFnet Lambda to StarLight)
- Amsterdam iGrid2002
  - Rechecking concepts models
  - Initial experiences and measurements
  - Expansion of Lambda testbed
- Reykjavik NORDUnet
  - Towards persistent demonstrations and applications
