Social Computational Trust Model (SCTM)

SARNET Alliance

Ameneh Deljoo

Motivation

Cyber attacks are **human** activities executed to achieve certain results. An effective **defense strategy** against such attacks require **organizations** next to **technical measures**, therefore:

- Cybersecurity needs principles that involve not only IT representations and architectures, but also the organizations and environments in which they are realized.
- Despite progress in cybersecurity on the technical aspects, big gaps remain, especially at the social and human levels.
- The social level **evolves** over time.
- Collaboration with the **right** partners to work **on joint tasks** is essential.
- Sharing with these partners that may be **competitors** in other aspects requires organizing **Trust**.

Trust as a key word..

- Trust reflects an **expectation** and, therefore, cannot be expressed **objectively**. It is influenced by subjective perceptions of the involved **actors**.
- Trust is **context** dependent and is basically valid within a **particular scope only**, such as the type of an activity and the organizational structure.
- Trust relies on previous interactions, i.e., from well-proven previous behavior a prediction of the future is inferred.

Trust Framework

Trustworthiness Components

- **Competence:** Potential **ability** of the evaluated entity to perform a **given task**.
- Integrity: Act accordingly to fulfil the commitments even when acting on them is not in self interest and accept the consequences.
- Benevolence: A disposition to do good and an act of kindness even if unforeseen contingencies arise.

Simulation Scenario

Goal:

- Define different type of domains
- Reason about trustworthiness components
 - Competence
 - Benevolence
- Evaluate trust in the network
- Observe members' behavior
- We use Agent Based Model as a tool to implement this scenario

Notation

- *X*, *Y* are two members (agents) of the alliance (*A*).
- Given two agents, x, y member's of A, to notate "x trusts y in the situation α " $Tr x(y, \alpha)$. $Tr x(y, \alpha) \in [0,1]$
- $E_x(x, y)$ denotes as the set of past interactions between x, y.
- $E_x(*, y)^1$ as the set of <u>All</u> the evidence on Y by others.
- Situations represent as a set of $\{S_1S_2 \ S_n\} \subset \alpha$
- The experience of an interaction is valuated by a function *O* mapping the fulfilment of the agreement between the two agents to a value [0,1]:

$$O = \begin{cases} F = 1\\ Fd = 0.5\\ V = 0 \end{cases}$$
 F = fulfilment, Fd = fulfilment with delay, V = violation of the agreement

 ${}^{1}E_{x}(x,y) \not\subset E_{x}(*,y)$

Trust Evaluation Framework:

Benevolence Evaluation

- Based on the <u>Direct</u> interactions between X and Y (in the situation α).
- At least two past interactions between X and Y.

$$Bn_{(x,y)} = 1 / E_{(x,y)} \sum (O(E_{(x,y)})_{S_n})$$

Result

• Three Outcomes (Always fulfill, fulfill with delay, Violation)

Competence Evaluation

- Competence = Ability to do the given task
- Based on the All the evidence on Z

Challenges:

- Resolving conflicts on the evidence
- Gather all the potential evidence may be hard
- Time restrictions on the decision-making

Competence Evaluation Scenarios

- 1. There is no evidence available from trustee (Z). To judge the trustee's competence.
 - Calculate Risk= (Cost * probability of non performance¹)/(Benefits * probability of performance)
- 2. There are some evidence but not for the considered context.
 - Competence associate with Risk = $\sum_{1}^{n} (O_{x(E(*, Z)_{S_n})}) \times \widehat{Tr}_{(X,Z)}$ Where
 - $\widehat{Tr}_{(X,Z)} = \sum_{1}^{n} T(x,z)_{S_n} / n$
- 3. There are related evidence about the agent in this or similar context.
 - Competence = $1/m \sum_{1}^{m} (O_x(E(*, z)_{S_m})/E(*, z))$

1) In calculating this performance we have to include time aspects (i.e. the results should be delivered within the decision-making time slot.

Result

Assumption:

- Agents are honest
- No conflicts on the agents' opinion
- 4 different situations
- 4 different agents

Agent's opinion in Situation S1				Agent's opinion in Situation S2				Agent's opinion in Situation S3				Agent's opinion in Situation S4

Competence = $1/m \sum_{1}^{m} (O_{x}(E(*, z)_{S_{m}})/E(*, z))$

Competence of Z from X point of view = 0.5Competence of Afrom X point of view = 0.87

Conclusion

- To better estimate this trustworthiness, it is important to estimate, competence and benevolence separately, and to combine them taking into consideration the particular situation and relationship.
- Any individual can estimate the **competence** and **benevolence** of trustees and combines these estimations in a dynamic way at any given **moment** and **situation**.
- We define different stages of relationships between the agents.
- We proposed a **general framework** that can be used in different **case studies**.

future Work

- Apply trust framework in other case studies
- Employ an evidential reasoning methods for the conflict situations.
- Evaluate integrity of Agents
- To move our collaborative single point defence strategy to a collaborative multi point defence strategy. This implies that we need to be able to understand collaborative attack strategies of our enemies.

"Trust is a social good to be protected just as much as the air we breathe or the water we drink. When it is damaged, the community as a whole suffers; and when it is destroyed, societies falter and collapse. (Bok, 1978, pp 26 and 27)"
